## Diffusion-Limited Aggregation

- Start with an immobile seed in a 2D, square grid.
- A walker is then launched from a random position far away and is allowed to diffuse by moving one grid space in a random direction each time step.
■ If the walker touches the seed, it is immobilized instantly and becomes part of the aggregate.
- Similar walkers are launched one-by-one and each of them stops upon hitting the cluster.
- Try imagining what the result of this process....

## DLA: (1 of 2)

- Create DLA_yourName.java that implements DiffusionLimited Aggregation on a 2D, $800 \times 800$ grid of pixel.
- Initialize the grid with one seed crystal in an interesting spot. Also create $n$ particles in random locations along the bottom.
- Each timestep, every non-crystalized particle moves, with equal probability, north, south, east or west by one pixel.
- If a particle moves out of the window, then reset its location, to a random spot along the bottom.

## Lab 4 DLA: (2 of 2)

- If a particle moves adjacent (by whatever definition you were assigned) to a crystalized particle, then the moving particle crystalizes:
a) Draw it in a color determined by whatever rules you have coloring.
b) Sets it x and y values to a random location along the bottom.
- Moving particles may pass through each other.
- All the colors must look good together.

## Creating and Using a 2D Array

int[][] grid = new int[15][9]
grid[2][1] = 1;
grid[1][1] = 5;
