CS-251 Coding Standards

• All projects and labs must follow the great and hallowed CS-251 coding standards.
• These standards do not necessarily represent the best nor the only good way to write Java code.
• If you have experience programming, then these standards may not be the standards you are used to using.
• However, in this class, these are the standards we will use.
Primary Reasons for Defined Standard

1. A standard makes it easier for the instructors to read your code.

2. A class standard makes it easier for a grader to recognize when a program does not use a consistent standard. Often when each student is allowed to define his or her own standard, students switch standards multiple times in a single project. It is tedious for a grader to deduce each persons standard and then check for self-consistency.

3. It is good practice to learn to follow a standard.
Coding Standard: Naming

- Multi-word names are generally written in mixed-case (also known as camelCase). Internal words start with a capital letter.
- All variables not declared `final` shall begin with a lowercase letter.
- Non-local variables that do not ever change value (that is, constants) shall be declared `final` and shall be all uppercase with words separated by underscores.
- All class and member variables (non-local variables) will be given descriptive names.
- Never use the single letter `l` nor the single letter `O` as a name.
Coding Standard: Naming

- Method names must be descriptive (usually verbs) and start with a lowercase letter.
- All class and interface names shall be descriptive (usually nouns) and begin with an uppercase letter.
Coding Standard - Indenting

- Code blocks will be indented to show the block structure with **four spaces** per level. (Note: I often use only two spaces in order to fit on the slides. Do as I say, not as I do.)
- Tab characters shall **not** be used for indenting.
- All statements within a block must be indented to the same level.
- You should be able to configure your text editor to use spaces to indent to the correct level when you type a tab.
**Coding Standard: Curly Braces**

- Open brace is last non-space character on a line.
- Closing brace begins a line and is indented to the beginning of the block.
- Exceptions: Empty/single statement class/method body.

```java
public class ExampleClass {
    private int myNumber;

    public static void main(String[] args) {
        // statements go here
    }

    private void emptyMethod() {}
    private void singleStatementBody() { myNumber++; }
}
```
Whenever a structure spans more than one line, curly braces \textit{must} be used. For example:

\begin{verbatim}
/* OK */
if (x == 5) y=y+1;

/* OK */
if (x == 5) { y=y+1; }

/* OK */
if (x == 5) {
    y=y+1;
    y=y+1;
}
\end{verbatim}

/* Not CS-251 standard */
if (x == 5) y=y+1;
Comments

• At the top of every .java file, there must be a Javadoc comment block with your name, a description of the what the class/interface is used for and how to use it.

• Before every public method, there must be a Javadoc comment block describing what the method does, its parameters, and its return value. (You may comment non-public methods, too, if you wish.)

• There must be a Javadoc comment describing any public variables, enums, nested classes, etc. (Again, good idea to comment non-public stuff too.)

For more information, see the Javadoc conventions online.
Coding Standard  80 Character Line Max

• No line shall be more than 80 characters.
• The best way to avoid overly long statements is by not doing too much in a single statement.
• Use temporary variables to break up large expressions.
• If you must keep a long statement, the statement should be broken in a logical place and each line over which the long statement is continued must be indented at least as much as the first line of the statement. (Use more indentation if it improves readability.)
Principle of Least Privilege

In computer science, the *Principle of Least Privilege* requires that in a particular abstraction layer of a computing environment, every module must be able to access only such information and resources that are necessary for its legitimate purpose.

- Variables used in only one method shall be local variables.
- Don’t make an instance or class variable public without good reason. (Note: “I couldn’t make it work otherwise” is not a good reason!)
Access Modifiers

• All methods, variables, nested classes, etc. contained within a class shall have an explicit access modifier.

• In other words, do not use package-private access in this course.

• Package-private access has a place in complex projects, but in this course, it is generally a sign that you forgot to use the access modifier.
Packages

- Unless otherwise specified, all code you submit for this course shall be placed in the default (nameless) package.
- Multiple packages are helpful for organizing larger programs, but it is overkill for our small labs.
Write Self-Documenting Code

- Self-documenting code uses well-chosen names and has a clear style.
- The program’s purpose and workings should be obvious to any programmer who reads the program, even if the program has no comments.
- To the extent that is possible, strive to make your programs self-documenting.
Java Code Conventions

For examples of how to format specific constructs and guidance on issues not covered in these slides, see Java code conventions online.
Last Word....

Use clean coding standards *as you code*.

- Of course, only the end product is graded; however, if you take the time to maintain proper indenting and formatting as you write your code, then you will find coding easier.
- When you show clean code to an instructor, the instructor is more likely to be friendly and will require less time to help you.
