Name: NetID:\_\_

Answer all questions in the space provided. Write clearly and legibly, you will not get credit for illegible or incomprehensible answers. This is a closed book exam. However, each student is allowed to bring one page of notes to the exam. Print your name at the top of every page.

Question:	1	2	3	4	5	6	7	8	Total
Points:	16	24	8	6	12	12	12	10	100
Score:									

- 1. Multiple choice questions: Select the single correct answer for each.
  - (a) Which interface would be the best choice to associate student usernames with Student objects?
    - B. Deque A. Collection C. List D. Map E. Set F. Queue
  - (b) Which interface would be the best choice to hold a collection of unique student usernames? (2)A. Collection B. Deque C. List D. Map E. Set F. Queue
  - (c) Which interface would be the best choice as a parameter of a method that can accept any (2)collection of student usernames, without assuming anything about order or uniqueness?
    - A. Collection B. Deque C. List D. Map E. Set F. Queue
  - (d) Which interface would be the best choice if you wanted to handle items in a LIFO (last (2)in, first out) order?
    - A. Collection B. Deque C. List D. Map E. Set F. Queue
  - (e) Which interface would be the best choice if you wanted to be able to randomly shuffle the order of the items?
    - A. Collection B. Deque C. List D. Map E. Set F. Queue
  - (f) Which type could **foo** be in the following code snippet?

boolean success = foo.contains("hello");

- A. Collection C. List E. Queue
  - D. Set F. SortedSet
- B. Deque H. None of these.
- (g) Which type could foo be in the following code snippet?

Object obj = foo.get(0);

- A. Collection C. List
- E. Queue
- G. Any of these.

- B. Deque
- D. Set
- F. SortedSet
- H. None of these.

G. Any of these.

- (h) Which of the following correctly declares and instantiates a map that associates String keys with Double values?
  - A. Map<String, Double> map = new HashMap<String, Double>();
  - B. HashMap<String, Double> map = new HashMap<String, Double>();
  - C. HashMap<String, Double> map = new HashMap<>();
  - D. Map<String, Double> map = new TreeMap<String, Double>();
  - E. Map<String, Double> map = new HashMap<>();
  - F. Map<String, Double> map = new TreeMap<>();
  - G. All of the above.
  - H. None of the above.

(2)

(1) If I have a variable of type Object, an object of any type could be assigned to it. If I call

the toString method on this variable, how does Java know which version of the method

method in its parent, but a different parameter list?

to execute?

3. Why don't the following code snippets compile? Select the single correct answer for each.

- A. Cannot access private variable x from a public method.
- B. Cannot access x without an instance of MyClass.
- C. Variable x is a constant, so cannot be incremented in main.
- D. The println method expects a String, not an int.
- E. Some other error.
- F. This code will successfully compile.

```
(b) List < boolean > truth Values; (2)
```

A. The list is not initialized.

- E. Some other error.
- B. Cannot use interface List as variable type.
- F. This code will successfully compile.
- C. Cannot use primitive type boolean as generic type parameter.
- D. List is an interface and cannot be instantiated.

```
(c) ActionListener listener = new ActionListener() {
    public void actionPerformed( ActionEvent ev ) {
        System.out.println( "Action happened" );
    }
};
```

- A. ActionListener is an interface and cannot be instantiated.
- B. Missing semicolon after call to ActionListener constructor.
- C. Extra curly braces around actionPerformed method.
- D. Need to add the listener to a JButton.
- E. Some other error.
- F. This code will successfully compile.

```
public class MyListener implements ActionListener {
   private int count = 0;
   public void actionPerformed( ActionEvent ev ) {
      count++
   }
}
```

- A. Missing constructor for MyListener class.
- B. Should use "extends" instead of "implements" in first line.
- C. Cannot access private variable count from a public method.
- D. Variable count is out of scope in the actionPerformed method.
- E. Some other error.
- F. This code will successfully compile.

4. Consider the following code.

```
(6)
import java.util.*;
public class MyPoint {
    private final int x;
    private final int y;
    public MyPoint(int x, int y) {
        this.x = x;
        this.y = y;
    }
    public int getX() { return x; }
    public int getY() { return y; }
    public String toString() {
        return "(" + x + ", " + y + ")";
    }
    public static void main(String[] args) {
        List < MyPoint > points = new ArrayList <>();
        points.add(new MyPoint(1,2));
        points.add(new MyPoint(3,4));
        points.add(new MyPoint(5,6));
        System.out.println("points = " + points);
        MyPoint p = new MyPoint(1,2);
        System.out.println("Is " + p + " in points? " + points.contains(p));
    }
}
```

The output of this code is

```
points = [(1, 2), (3, 4), (5, 6)]
Is (1, 2) in points? false
```

- Why isn't my point (1, 2) found in the list even though I see (1, 2) when I print the list?
- What should I do to fix this without changing the main method?

5. Consider the following classes. What is the output of this code?

```
(12)
```

```
public class Foo {
                                       public class Bar extends Foo {
    protected double x;
    protected static int y = 10;
                                           public Bar(String x) {
    protected String z;
                                               y++;
                                               System.out.println(x);
    public Foo() {
        this("Winter");
                                           public Bar(String y, int x) {
        y++;
                                               super(y);
                                               System.out.println(x);
    public Foo(String x) {
        this.x = x.length() / 4.0;
        this.z = x;
                                           public void doPrint(int x) {
        y++;
                                               System.out.println(x);
    }
                                               doPrint(x * 1.25);
    public void doPrint(String y) {
        System.out.println(x);
                                           public void doPrint(String z) {
        System.out.println(y);
                                               super.doPrint(z);
        System.out.println(z);
                                               doPrint( y / 2 );
    }
                                           }
    public void doPrint(double z) {
                                           public static void main(String[] args) {
                                               Foo a = new Bar("CS251");
        System.out.println(y);
                                               a.doPrint("Final");
        System.out.println(z);
    }
                                               Bar b = new Bar("Exam", 42);
                                               b.doPrint(2);
}
                                           }
```

6. Consider the following classes.

```
public class Parent {
                                   public class Child extends Parent {
    public void methodA() {
                                       public void methodA(int n) { }
        System.out.println("A");
                                       public void methodB() { }
                                       public void methodC() { }
    public void methodB() {
                                       public static void main(String[] args) {
        System.out.println("B");
                                           Parent x = new Parent();
}
                                           Child y = new Child();
                                           Parent z = new Child();
                                           // What works here?
                                       }
```

(12)

(12)

Which of the following lines of code would successfully compile and run when placed in the main method of Child after the code that is already there? Select all that apply.

```
A. x.methodA();
                                     M. Child c = (Child)x;
B. y.methodA();
                                     N. ((Child)x).methodC();
C. z.methodA();
                                     O. ((Child)z).methodC();
D. x.methodA(42);
                                     P. Object obj = new Parent();
                                     Q. Child obj = new Parent();
E. y.methodA(42);
F. z.methodA(42);
                                     R. Parent obj = new Child();
G. x.methodB();
                                     S. Parent p = x;
H. y.methodB();
                                     T. Parent p = y;
I. z.methodB();
                                     U. Parent p = z;
J. x.methodC();
                                     V. Child c = x;
                                     W. Child c = y;
K. y.methodC();
                                     X. Child c = z;
L. z.methodC();
```

7. Consider the following interface describing a to-do list with tasks represented as Strings.

```
import java.util.*;
public interface ToDoInterface {

   /**
    * Adds a task to the todo list.
    * @param task The task to add.
    */
   void addTask(String task);

   /**
    * Removes a task from the todo list after completion.
    * (It is possible the completed task is not the expected next task.)
    * @param task The completed task.
    */
   void completeTask(String task);
```

```
/**
  * Get the next task from the todo list.
  * (Does not remove the task from the todo list.)
  * @return Next task to do, or null if none left.
  */
String getNextTask();

/**
  * Get all the tasks on the todo list.
  * @return All tasks we still have to do.
  */
Collection<String> getAllTasks();
}
```

Write a small but complete class that implements this interface, handling the tasks in a first-in-first-out order. Use a private member variable of an appropriate collection type to hold the tasks. You do not need to include Javadoc comments.

8. Consider the following program. What would be displayed when it is run? Draw a picture to illustrate.

(10)

```
import java.awt.*;
import javax.swing.*;
public class LayoutExample {
    public static void createAndShowGUI() {
        JFrame frame = new JFrame("Last Problem!");
        frame.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);
        JPanel panel1 = new JPanel();
        panel1.add(new JButton("A"));
        panel1.add(new JButton("B"));
        JPanel panel2 = new JPanel();
        panel2.setLayout(new BoxLayout(panel2, BoxLayout.PAGE_AXIS));
        panel2.add(new JButton("C"));
        panel2.add(new JButton("D"));
        panel2.add(new JButton("E"));
        frame.add(new JButton("F"), BorderLayout.CENTER);
        frame.add(panel1, BorderLayout.PAGE_START);
        frame.add(panel2, BorderLayout.LINE_END);
        frame.pack();
        frame.setVisible(true);
    }
    public static void main(String[] args) {
        SwingUtilities.invokeLater(new Runnable() {
                public void run() {
                    createAndShowGUI();
            });
    }
```
