## Another Example \_\_\_\_\_ In-Class Exercise Show that for f(n) = n + 100 and $q(n) = (1/2)n^2$ , that $f(n) \neq 100$ • Let $f(n) = 10 \log^2 n + \log n$ , $g(n) = \log^2 n$ . Let's show that $\Theta(q(n))$ $f(n) = \Theta(g(n)).$ • We want positive constants $c_1, c_2$ and $n_0$ such that $0 \le c_1 g(n) \le f(n) \le c_2 g(n)$ for all $n \ge n_0$ • What statement would be true if $f(n) = \Theta(q(n))$ ? • Show that this statement can not be true. $0 < c_1 \log^2 n < 10 \log^2 n + \log n < c_2 \log^2 n$ Dividing by $\log^2 n$ , we get: $0 < c_1 < 10 + 1/\log n < c_2$ • If we choose $c_1 = 1$ , $c_2 = 11$ and $n_0 = 2$ , then the above inequality will hold for all $n > n_0$ 12 13 Recurrence Relation Review \_\_\_\_\_ Recurrence Relations \_\_\_\_\_ "Oh how should I not lust after eternity and after the nuptial ring of rings, the ring of recurrence" - Friedrich Nietzsche, Thus Spoke Zarathustra • Whenever we analyze the run time of a recursive algorithm, • T(n) = 2 \* T(n/2) + n is an example of a *recurrence* relation we will first get a recurrence relation • To get the actual run time, we need to solve the recurrence • A *Recurrence Relation* is any equation for a function T, where relation T appears on both the left and right sides of the equation. • We always want to "solve" these recurrence relation by getting an equation for T, where T appears on just the left side of the equation
